

Optimal vision for an improved handicap
The new raylor from adidas eyewear

raylor shiny brown

raylor shiny pink

Golf is a complex sport, with absolute concentration and a clear view being essential requirements to achieve a successful handicap. With its new raylor model, the sports eyewear specialist adidas eyewear is launching extremely lightweight golf glasses, designed to ensure optimal vision to boost your success on the green.

As well as a skilful driving technique and a strong mental attitude, the ability to read and assess the terrain is a decisive factor in golfing. Where does the fairway end and the green start? How much of a slope is there, how long is the grass? To achieve a perfect drive or putt, it is essential for golfers to form a precise picture of their surroundings on the course. High-quality golf glasses help - like the raylor from adidas eyewear.

As well as its first-class function and modern design, the new raylor is distinguished by its extremely light weight. The highly curved LST™ filters are specially designed for golfing, guaranteeing an all-round view as well as perfect protection from glare, UV rays and insects. The filters also increase contrast and compensate for light variations. This helps the golfer to clearly identify all bumps and texture variations on the ground and plan his or her next stroke with precision. To allow golfers to respond to different weather conditions, adidas eyewear offers a wide range of filters. The frame is made from very lightweight and robust SPX material. The eyewear is very comfortable to wear, thanks to the bridge which is adjustable in two directions and the non-slip temples, which also fit unobtrusively under a cap or visor. Ensuring that the eyewear stays firmly in place and barely noticeable on your head, even during energetic swings.

The raylor is available in shiny black, shiny white, shiny pink and shiny brown. It guarantees a perfect, sporty look both on and off the green.

To compensate for poor vision, the sports eyewear can be equipped with optical correction: either with direct glazing using an adapter system or by means of an optical insert secured on the bridge behind the filters.

Like all other models in the adidas eyewear collection, the raylor is designed and manufactured by the respected eyewear producer Silhouette International in Austria.
